

Project Proposal

ASHO-UAB · FIRST FOLLOW-UP PRESENTATION

Albert Saludas & Noa Solé

Dataset Analysis

11, 832
total claims

9,832
train samples

~600 words
median main_text

~11 words
median claim length

Label Distribution (Train)

- Class Imbalance → Use Macro F1 as primary metric
- main_text max 7,067 words → truncation needed (512-token limit)
- claim is short → safe to concatenate claim + main_text as model input
- labels are strings ('true', 'false',...) → encode before training

Proposed Solution • Three-Stage Pipeline

based on our analysis of the problem and the literature review

Next Steps

Goal: working baseline +
explainability demo for next
follow up

- 1 **Pre-process:** encode labels, handle NULLs, tokenise with PubMedBERT tokeniser, set truncation strategy
- 2 **Fine-tune baseline PubMedBERT** – report Macro F1 on validation split
- 3 **Integrate SHAP** – spot-check explanations against gold explanation field
- 4 **Prototype RAG pipeline** – connect PubMed API, run on 50 unseen claims

The End

THANK YOU FOR LISTENING
